django-static-templates provides a management command to render Django templates as static files. Example usage might be static error pages to be delivered by your reverse proxy if the Django application dies.

CHAPTER 1

Features

- Management command `render_static_templates` to create static files in your `STATIC_ROOT`.
- Helpers to render templates as static files

CHAPTER 2

Requirements

django-static-templates supports Python 3 only and requires at least Django 1.11.

CHAPTER 3

Prepare for development

A Python 3.6 interpreter is required in addition to pipenv.

```
$ pipenv install --python 3.6 --dev
$ pipenv shell
$ pip install -e .
```

Now you're ready to run the tests:

```
$ pipenv run py.test
```

Contents:

4.1 Installation

- Install with pip:

```
pip install django-static-templates
```

- Your `INSTALLED_APPS` setting:

```
INSTALLED_APPS = (  
    # ...  
    'static_templates',  
)
```

4.2 Usage

4.2.1 Configure templates to render

To configure the templates that should be rendered as static files, add the `STATIC_TEMPLATES` setting to your configuration.

```
STATIC_TEMPLATES = (  
    ('some-template.html', 'rendered.html'),  
    ('500.html', 'errors/500.html'),  
)
```

The setting should be a iterable that returns tuples with to elements. The tuple's first element is the template path, the second is the path inside `settings.STATIC_ROOT` where the rendered content should be stored.

4.2.2 Providing extra context to the templates

Remember that the templates are rendered using Django's `render_to_string`. If you need extra context when rendering the templates, configure `STATIC_TEMPLATES_CONTEXT` as a dictionary.

```
STATIC_TEMPLATES_CONTEXT = {  
    'DEBUG': False,  
    'RAVEN_DSN': 'Some token'  
}
```

4.2.3 Using a different renderer

If you want to change the way the templates are rendered, you can override the used renderer by configuring the `STATIC_TEMPLATES_RENDERER` setting.

By default, `static_templates.renderer.Renderer` is used. Feel free to sub-class and extend the functionality.

4.2.4 Rendering the templates

To render the templates, use the management command `render_static_templates`.

```
$ python manage.py render_static_templates
```

4.3 Changelog

4.3.1 0.0.2 (2020-04-16)

- Pass request to `render_to_string`

4.3.2 0.0.1 (2018-08-08)

- Initial release of *django-static-templates*

Api documentation:

4.4 static_templates.renderer

class `static_templates.renderer.Renderer` (*configuration, stdout=None*)

Bases: `object`

Renderer is used to convert a template into a static file.

__init__ (*configuration, stdout=None*)

The init function takes a row from settings.STATIC_TEMPLATES. By default, the users are required to provide a two-item tuple with the template name and the static file path.

configuration = `None`

stdout = `None`

log (*message*)

render ()

render starts the rendering process for the given configuration.

get_template_name ()

Returns the template name to use when rendering to static.

get_template_context ()

Provides the context for render_template call.

render_template ()

Creates a fake request context together with the context from get_template_context and returns the rendered output.

get_static_file_path ()

Returns the target static file path to store the content to.

write_static_file (*content*)

write_static_file makes sure that the target directory exists and writes the provided content to a file.

`static_templates.renderer.get_renderer` (*path=None*)

Load a renderer and return the class. If a path is provided, the renderer is imported from that path. By default, `static_templates.renderer.Renderer` is used.
